

TST SLAP BANDS AND AIDE MEMOIRE CARDS

- ✓ UKCA Marked
- ✓ CE Marked

Ten Second Triage (TST) has been designed as a preliminary triage tool to be used by any responder at a major incident, such as police officers or firefighters. TST is intended as a quick and simple triage method, following a straightforward algorithm assessing whether the patient is walking, talking, breathing or not breathing, in addition to checking for any central penetrating injury. The TST tool's simplicity minimises cognitive burden, freeing responders to treat casualties in challenging circumstances. The triage process should be undertaken swiftly, ideally limited to ten seconds for the preliminary assessment of each patient. Scene management triage solutions are crucial in mass casualty situations, involving the rapid assessment and categorisation of patients based on injury severity at an incident scene.
